

Aventus launches in to market

Putting the 'E' back in to HSE

Aventus Consulting is a niche environmental consultancy, established by Giulio Pinzone in June 2009 in response to operators' requests for assistance in the environmental arena.

The business' key objectives are to partner with the upstream oil and gas industry to obtain project environmental approvals and to guide clients through on-ground environmental management.

In an industry heavily focused on the management of safety, it is all too common to find that health, safety and environment (HSE) personnel lack knowledge of the industry's specific environmental requirements (theoretical, practical or regulatory). Too often, this results in avoidable mistakes during project development.

Aventus Consulting's philosophy is to correct this situation and put the 'E' back into HSE!

Aventus Consulting started life with contracts for two of Australia's largest petroleum exploration and production companies and aims to build on this momentum.

Large, small...long-term, short-term....in-house, office or remote....project or operational advice, Aventus Consulting is your environmental partner.

A unique blend of consulting and upstream petroleum industry experience

Upstream petroleum environmental approvals and management

Aventus Consulting is uniquely positioned to act on its philosophy because its founder has spent 10 years working in the environmental impact assessment (EIA) and management field, with experience in both the consulting and in-house upstream petroleum industry worlds.

This unique combination of knowledge and skills is hard to find in any one consultancy. The ability to use industry knowledge and experience to prepare EIAs and guide clients through the regulatory and community consultation minefield, together with practical experience to oversee implementation in the field, allows clients to be confident they can achieve their environmental objectives while minimising risk.

Aventus Consulting can help with these onshore and offshore activities:

- Seismic, geophysical and geotechnical surveys
- Pipeline route selection and construction
- Drilling
- Facility development and installation.

The services on offer include:

- EIA in accordance with relevant legislation and regulations
- Environment Plans (offshore) and Environmental Management Plans (onshore)
- Auditing and construction supervision
- Corporate regulatory reporting
- In-house environmental operations or project advice and coordination.
